

MDI 115 - 1

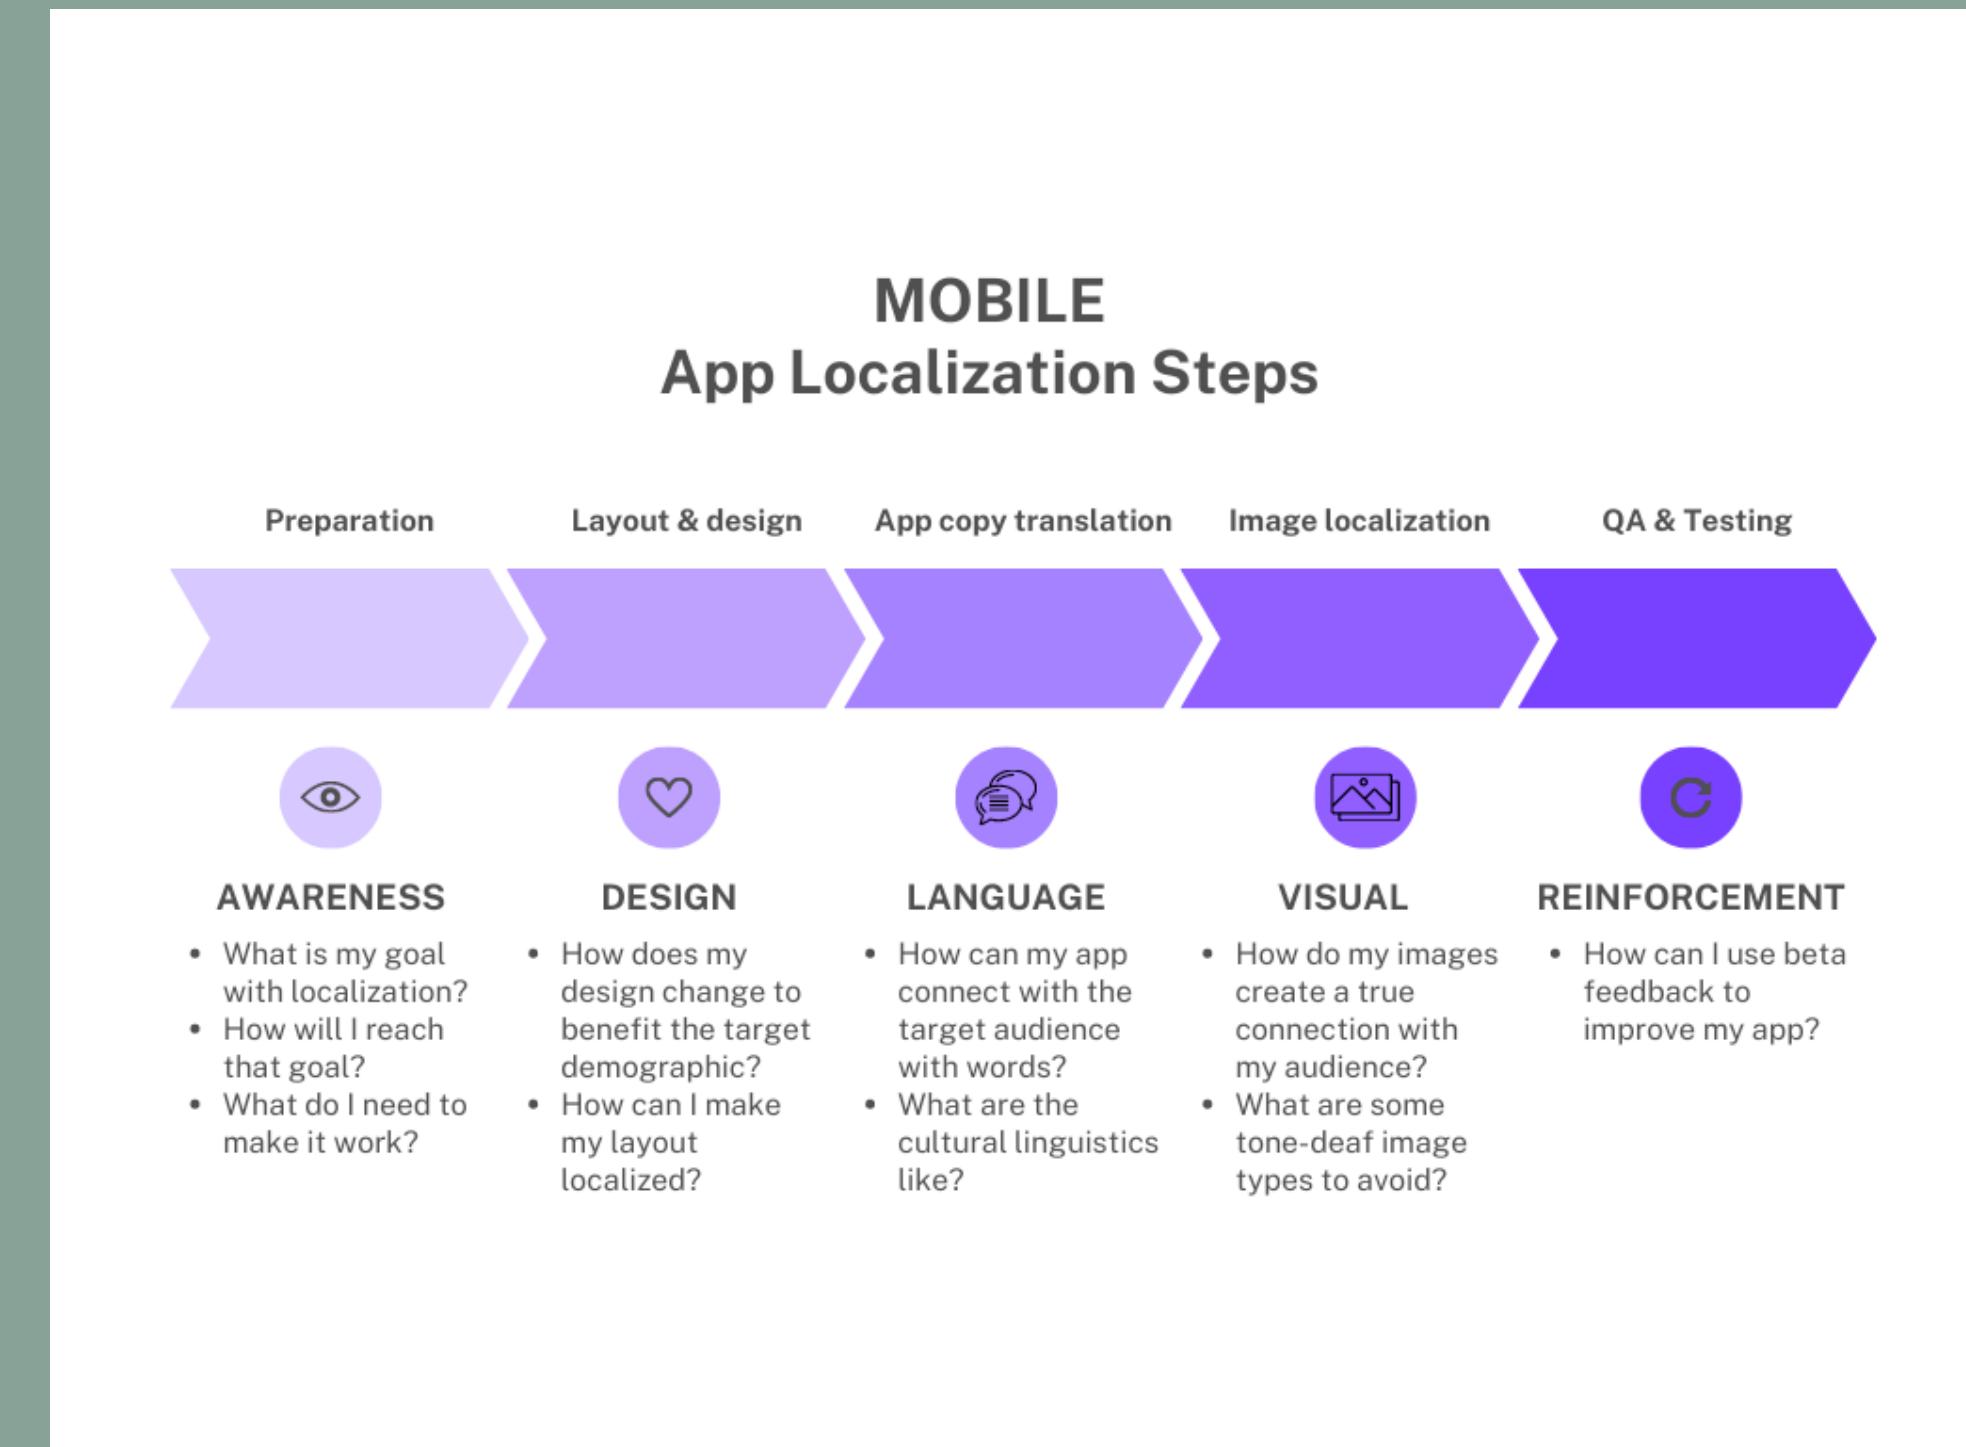

Localizing Your SwiftUI iPadOS Apps

Gabriela Sánchez Alcaraz

Introduction to Localization

Why Localization Matters in Development

Introduction to Localization

Why Localization Matters in Development

- The App Store is a World Market: Your app can be downloaded in over 175 countries.
- Enhanced User Experience: Users prefer apps in their native language. It feels more intuitive, trustworthy, and professional.
- Increased Downloads & Revenue: Localizing your app can significantly expand your user base and boost engagement.
- Competitive Advantage: A well-localized app stands out from the competition

Adaptive Layouts in SwiftUI

**SwiftUI is built for
flexibility. Avoid fixed sizes!**

Stacks

(HStack, VStack, ZStack): These are naturally adaptive.

```
import SwiftUI

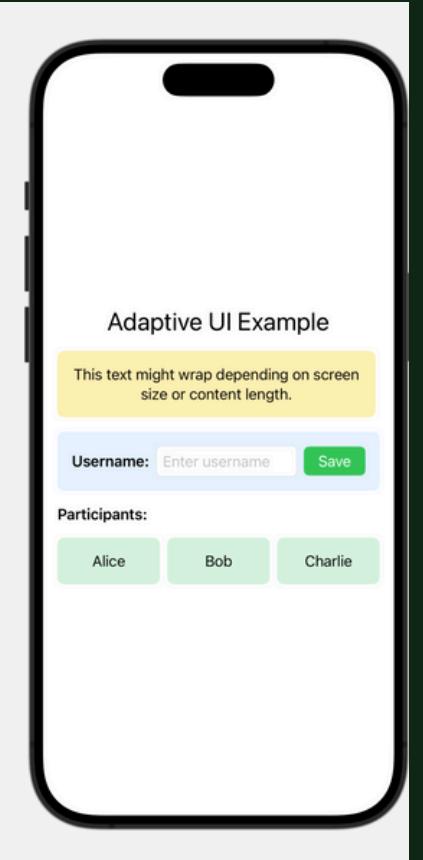

struct ContentView: View {
    @State private var username: String = ""
    @State private var participants: [String] = ["Alice", "Bob", "Charlie"]

    var body: some View {
        GeometryReader { geometry in
            ScrollView {
                VStack(alignment: .leading, spacing: 16) {
                    Text("Adaptive UI Example")
                        .font(.title)
                        .frame(maxWidth: .infinity, alignment: .center)

                    Text("This text might wrap depending on screen size or content length.")
                        .lineLimit(nil)
                        .multilineTextAlignment(.center)
                        .padding()
                        .background(Color.yellow.opacity(0.3))
                        .cornerRadius(8)

                    HStack {
                        Text("Username:")
                            .bold()
                        TextField("Enter username", text: $username)
                            .textFieldStyle(RoundedBorderTextFieldStyle())
                    }

                    Button(action: {
                        let trimmed = username.trimmingCharacters(in: .whitespacesAndNewlines)
                        if !trimmed.isEmpty {
                            participants.append(trimmed)
                            username = ""
                        }
                    }) {
                        Text("Save")
                    }
                }
            }
        }
    }
}
```

Grids

(Grid, LazyVGrid): Great for arranging content that can reflow.

```
import SwiftUI

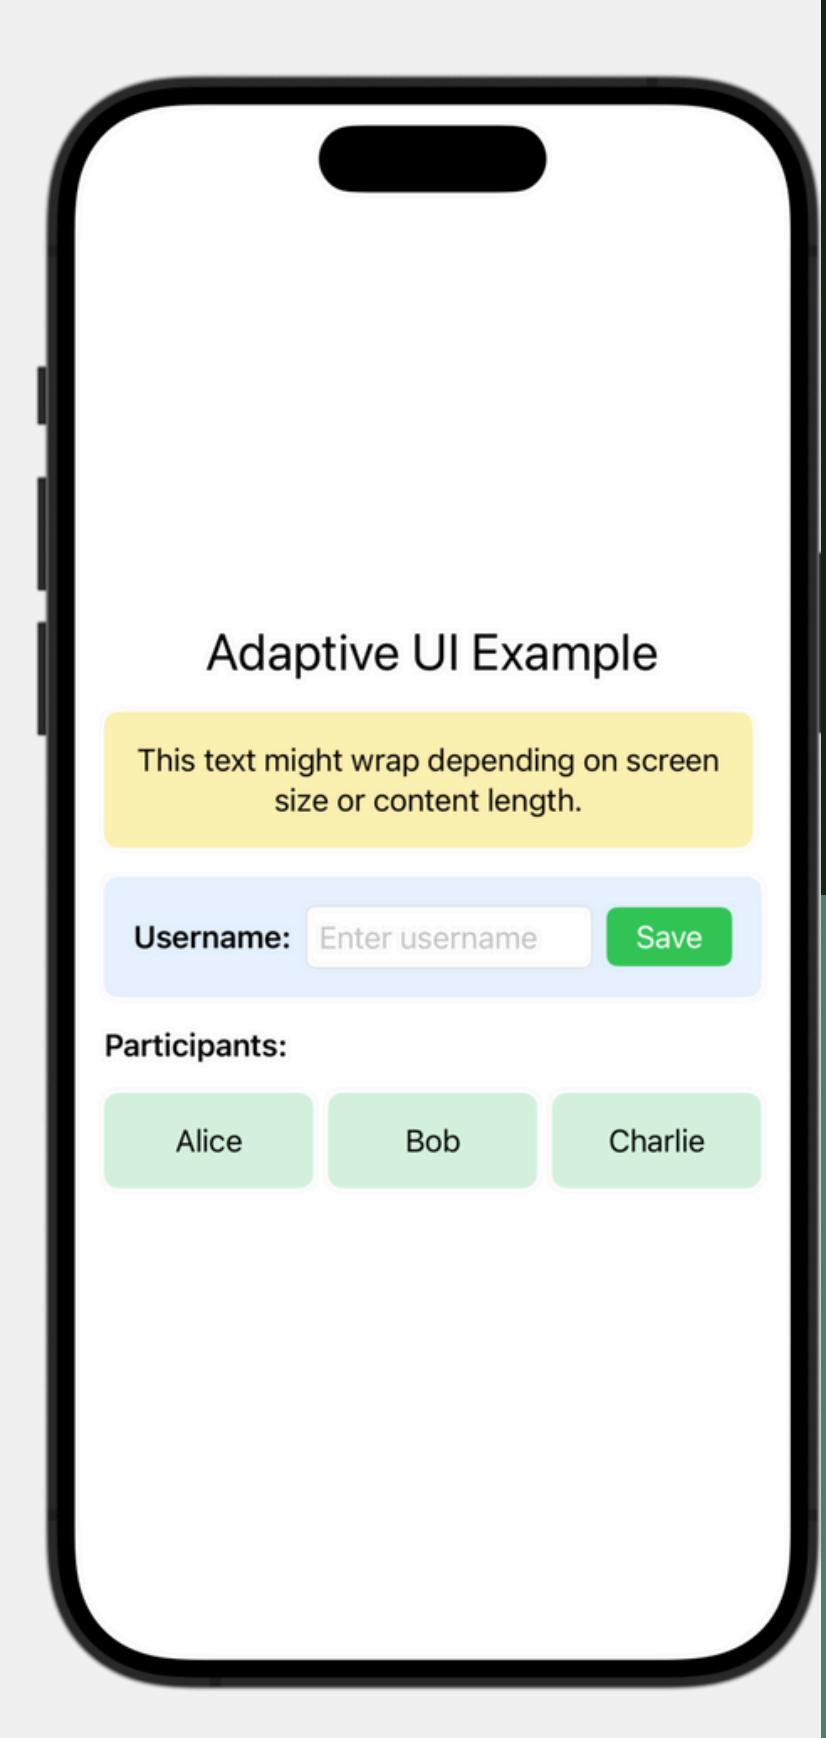

struct ContentView: View {
    @State private var username: String = ""
    @State private var participants: [String] = ["Alice", "Bob", "Charlie"]

    var body: some View {
        GeometryReader { geometry in
            ScrollView {
                VStack(alignment: .leading, spacing: 16) {
                    Text("Adaptive UI Example")
                        .font(.title)
                        .frame(maxWidth: .infinity, alignment: .center)

                    Text("This text might wrap depending on screen size or content length.")
                        .lineLimit(nil)
                        .multilineTextAlignment(.center)
                        .padding()
                        .background(Color.yellow.opacity(0.3))
                        .cornerRadius(8)

                    HStack {
                        Text("Username:")
                            .bold()
                        TextField("Enter username", text: $username)
                            .textFieldStyle(RoundedBorderTextFieldStyle())
                    }

                    Button(action: {
                        let trimmed = username.trimmingCharacters(in: .whitespacesAndNewlines)
                        if !trimmed.isEmpty {
                            participants.append(trimmed)
                            username = ""
                        }
                    }) {
                        Text("Save")
                    }
                }
            }
        }
    }
}
```

Key Terminology

Understanding Localization Terms

Internationalization (I18n)

- **The Foundation.** Designing your app so it can be adapted to various languages and regions without engineering changes.
 - Think: Flexible architecture.

Examples:

- Using adaptive UI layouts.
 - Not hardcoding text.
 - Handling dates, numbers, and currencies correctly.

Localization (L10n)

- **The Adaptation.** The process of actually translating and adapting your app for a specific language and region (a "locale").
 - Think: Specific content.

Examples:

- Translating text strings to Spanish.
 - Displaying dates as DD/MM/YYYY for the UK.
 - Changing colors or images to be culturally appropriate

Internationalization: Building a "World-Ready" App

Understanding the process in app development

What is Internationalization?

Internationalization (i18n) involves designing applications to support multiple languages and regions seamlessly, ensuring developers don't need to redesign the app for different locales or cultural contexts.

Never Hardcode User-Facing Text:

Text("Hello, World!") vs. Text(LocalizedStringKey("welcome_message"))

Design Flexible Layouts:

Text length varies dramatically between languages. "Save" in English is "Speichern" in German.

Externalize Resources:

Keep strings, images, and other assets separate from your executable code.

Understanding Localization

The foundation of app internationalization

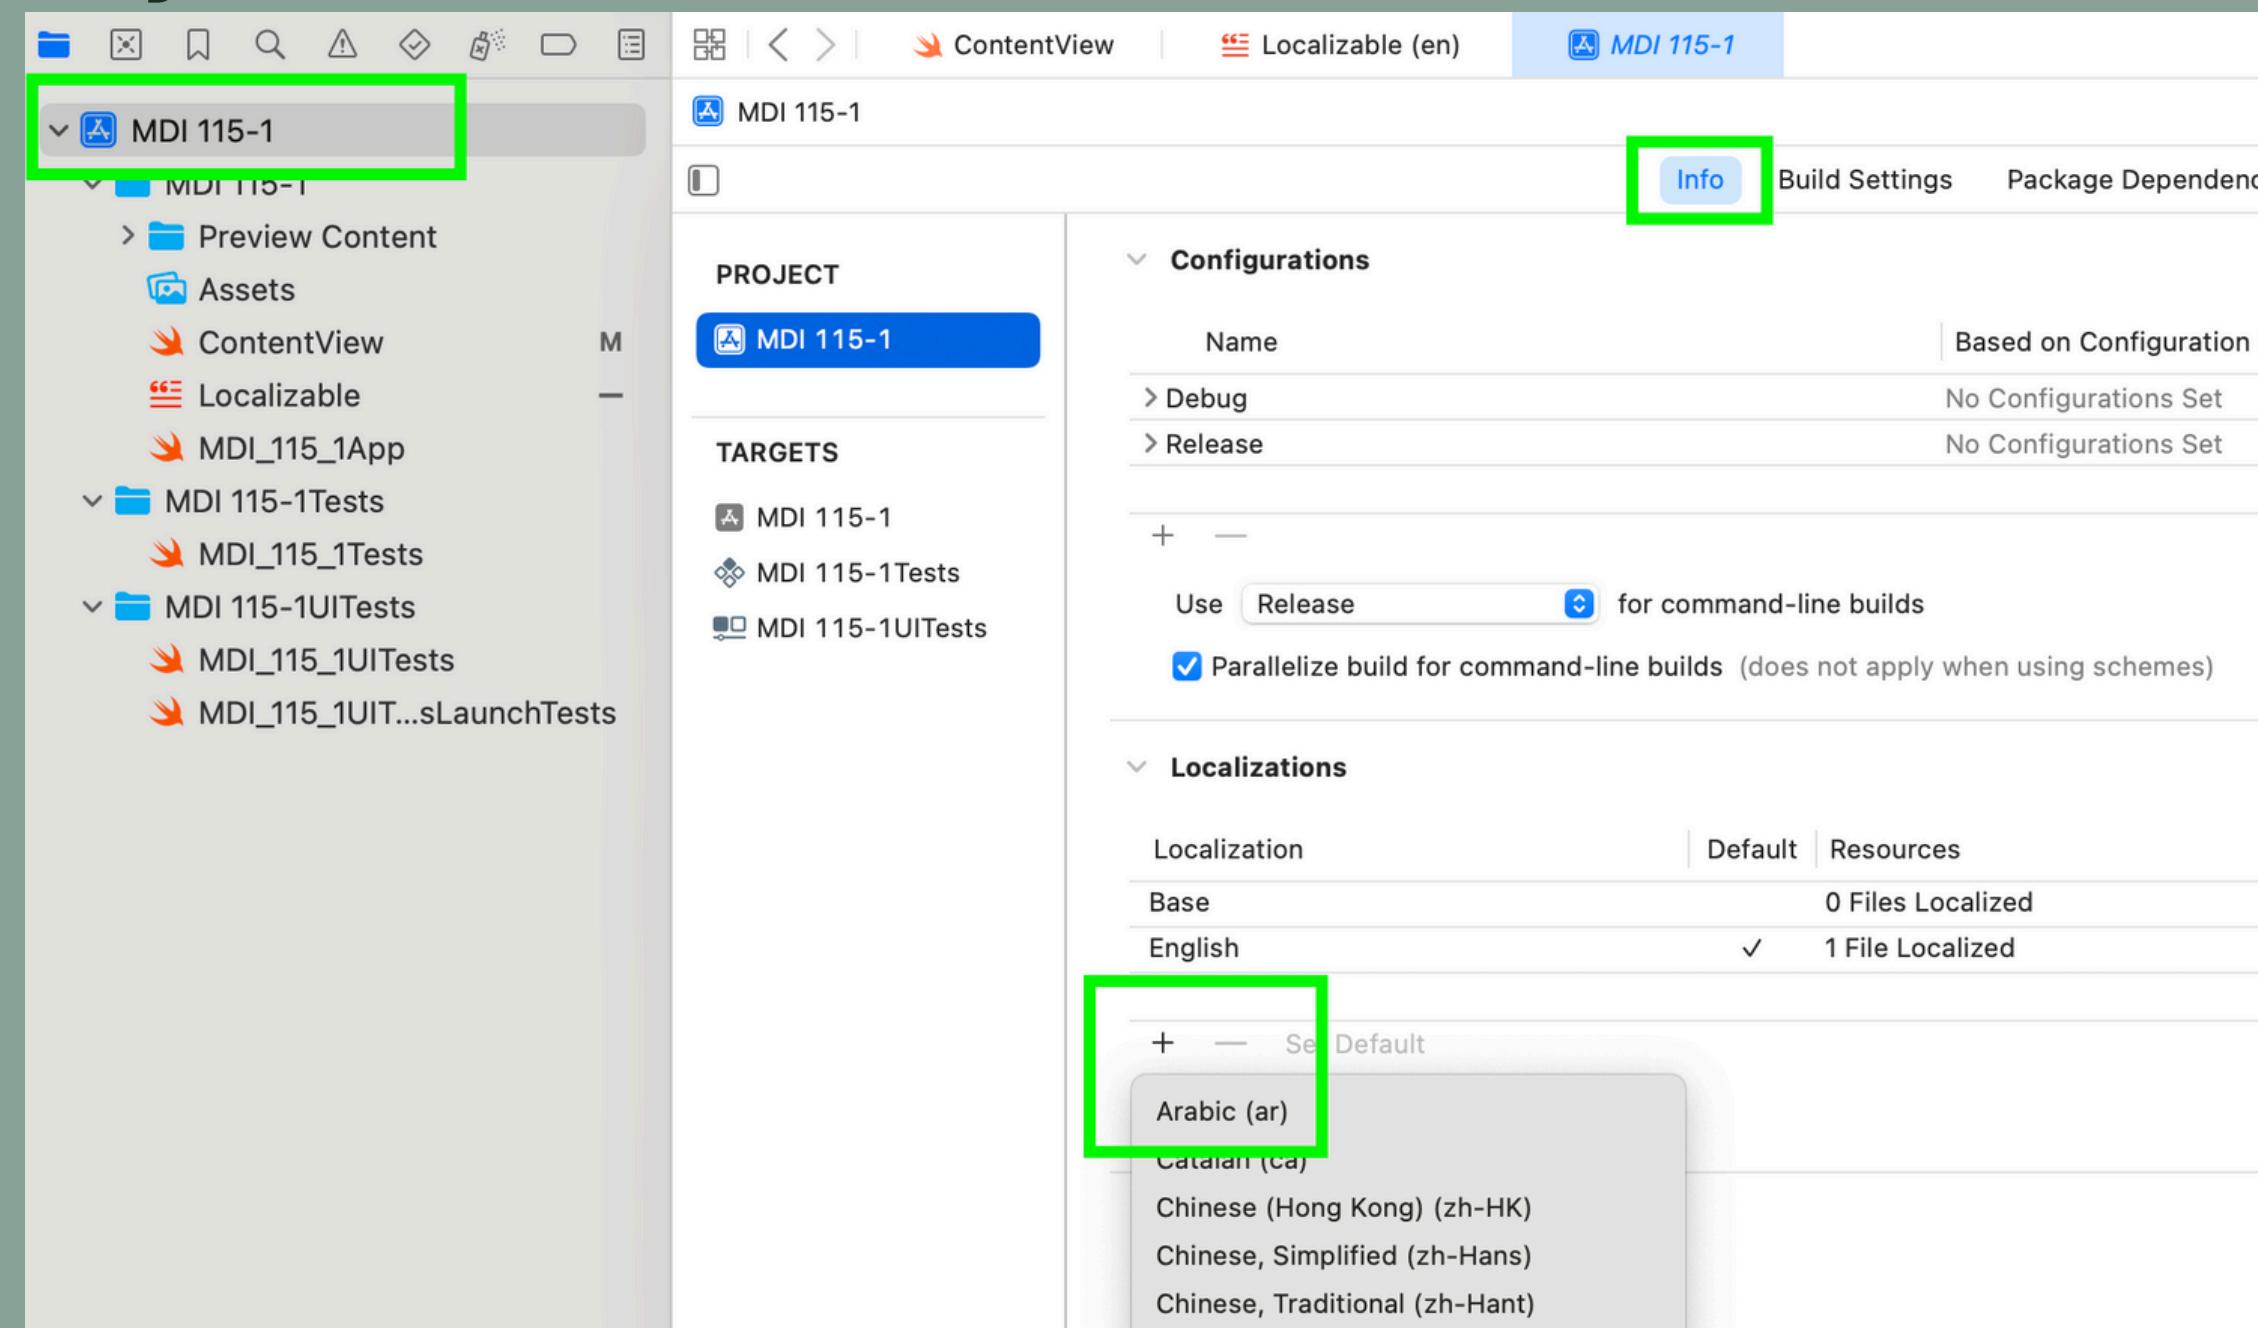

Defining Localization

Localization is the process of adapting app content to meet the specific language, region, and cultural expectations of users, ensuring a more relatable and engaging experience for diverse audiences.

- Localization Catalog (.xcstrings): The modern, recommended way to manage all your localizable content.
 - A single, structured file for all languages.
 - Shows translation status (New, Stale, Translated).
 - Allows you to add comments for translators.

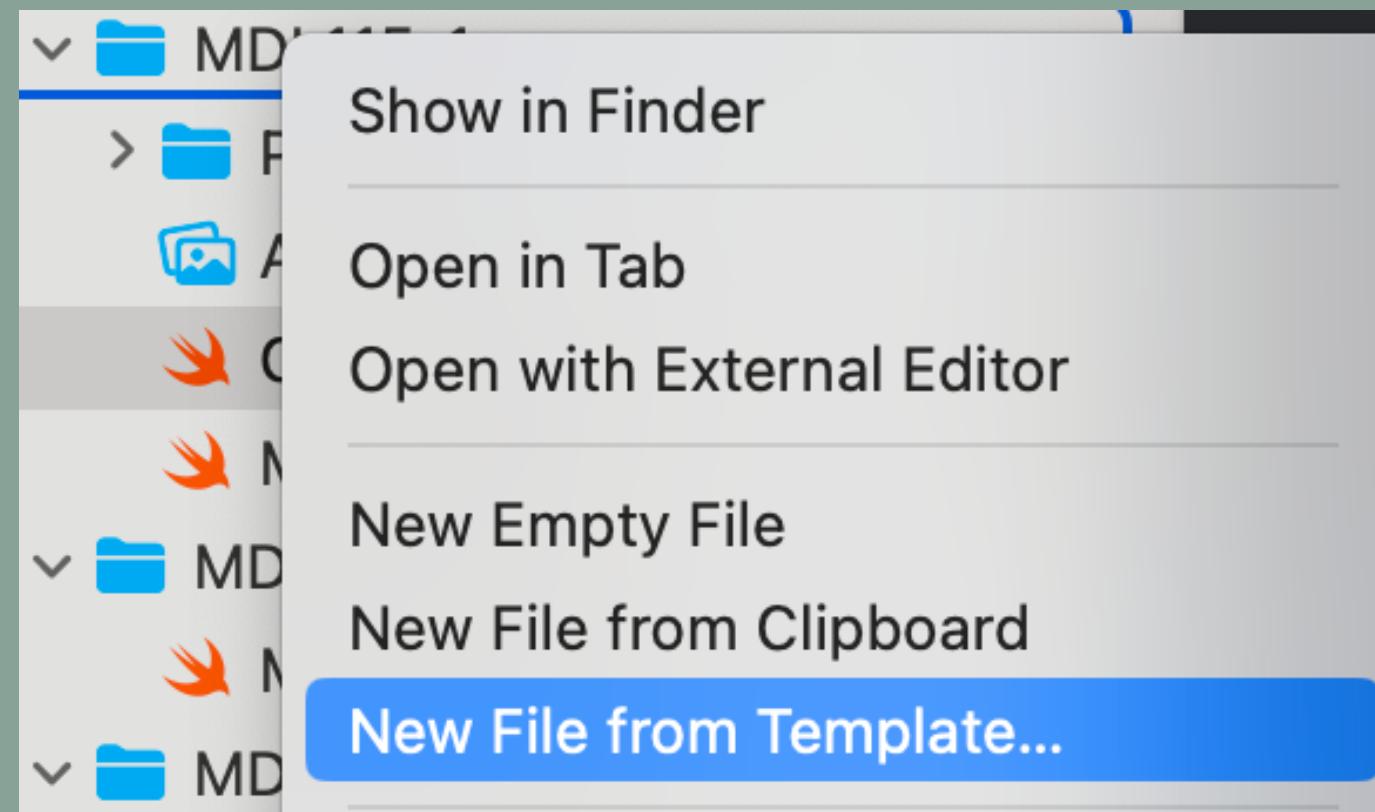

Setting up your languages with Regions

Project

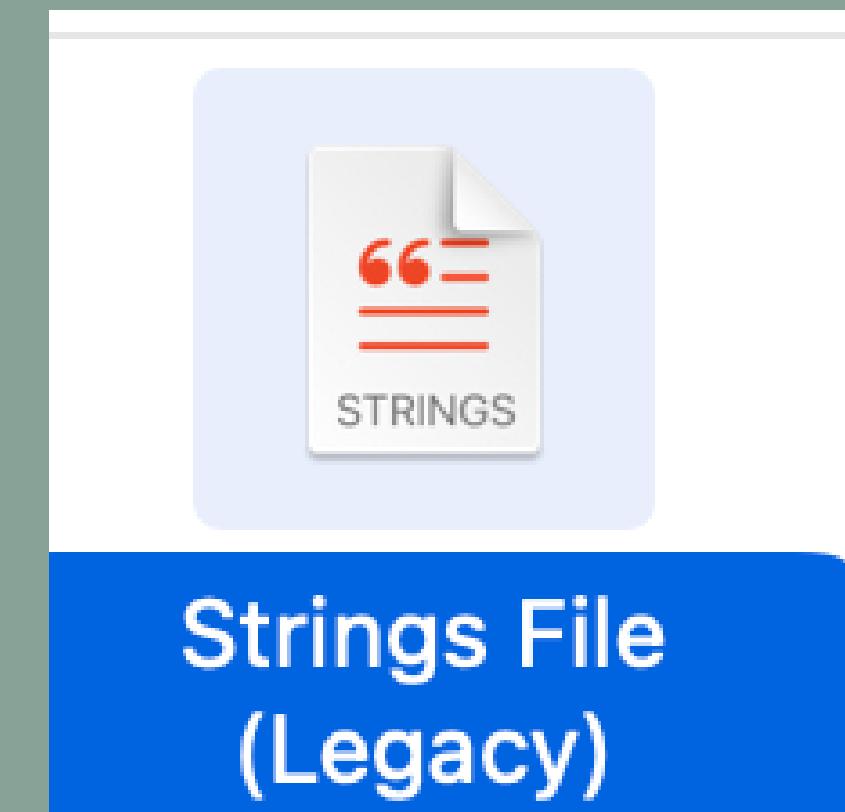

1. Select your main project.
2. Click on Info and select your project Settings
3. Add a new Localization (language + region)

Strings File

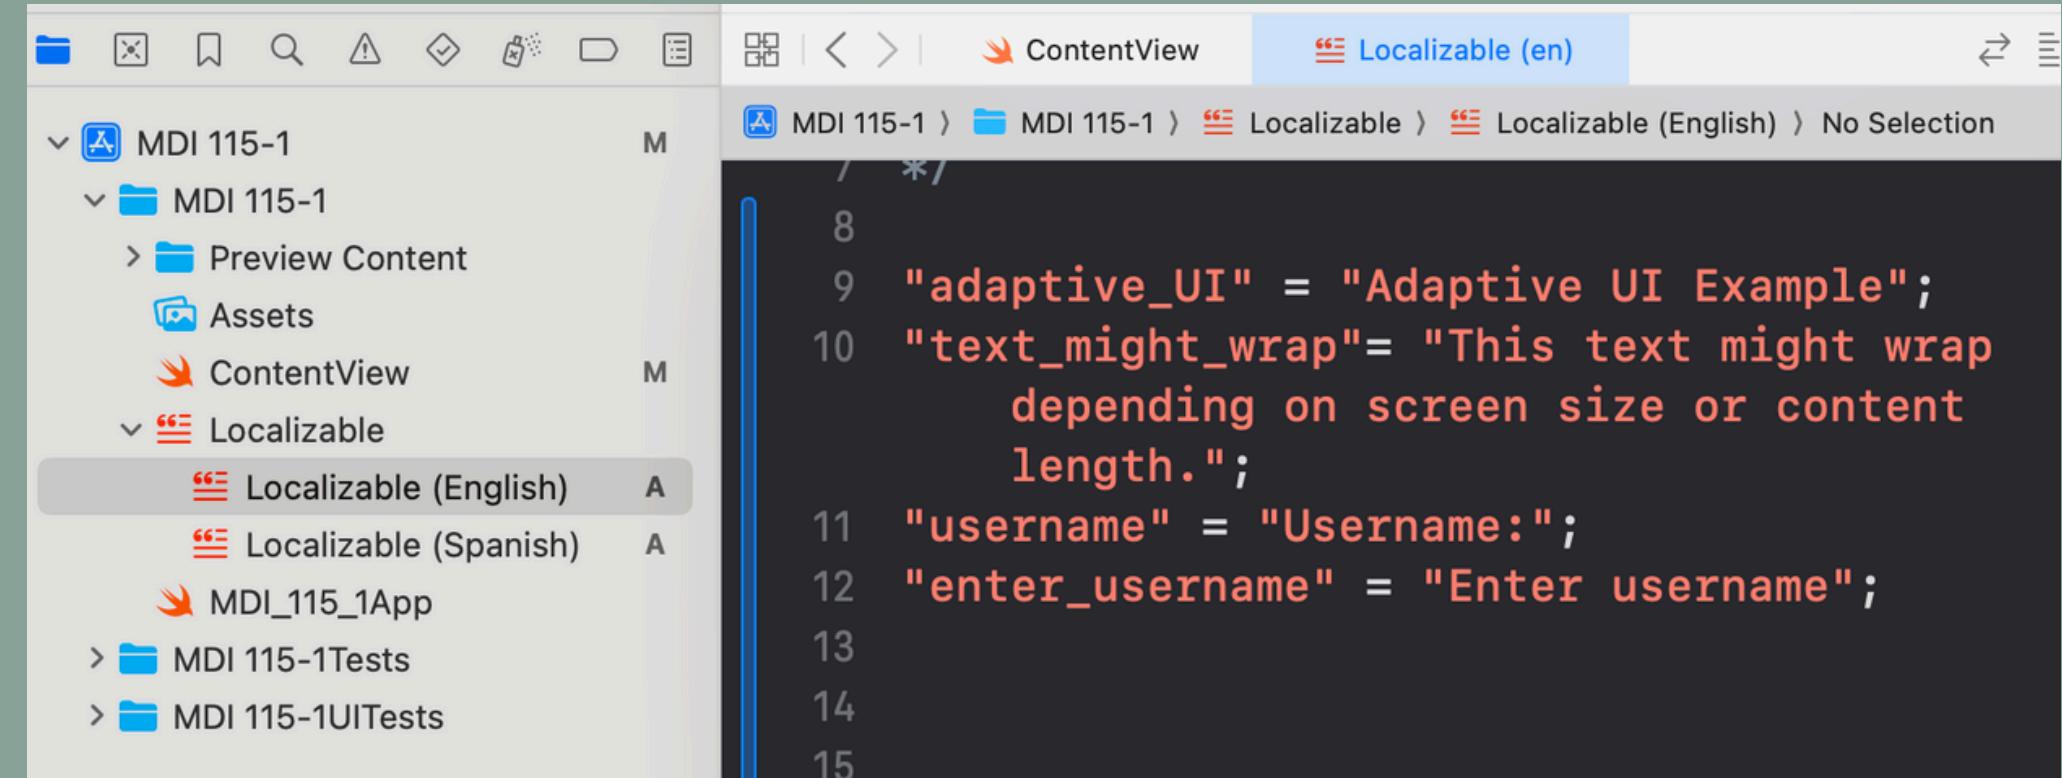

Step 1
Add a new file

Step 2
Search for Strings File

Strings File

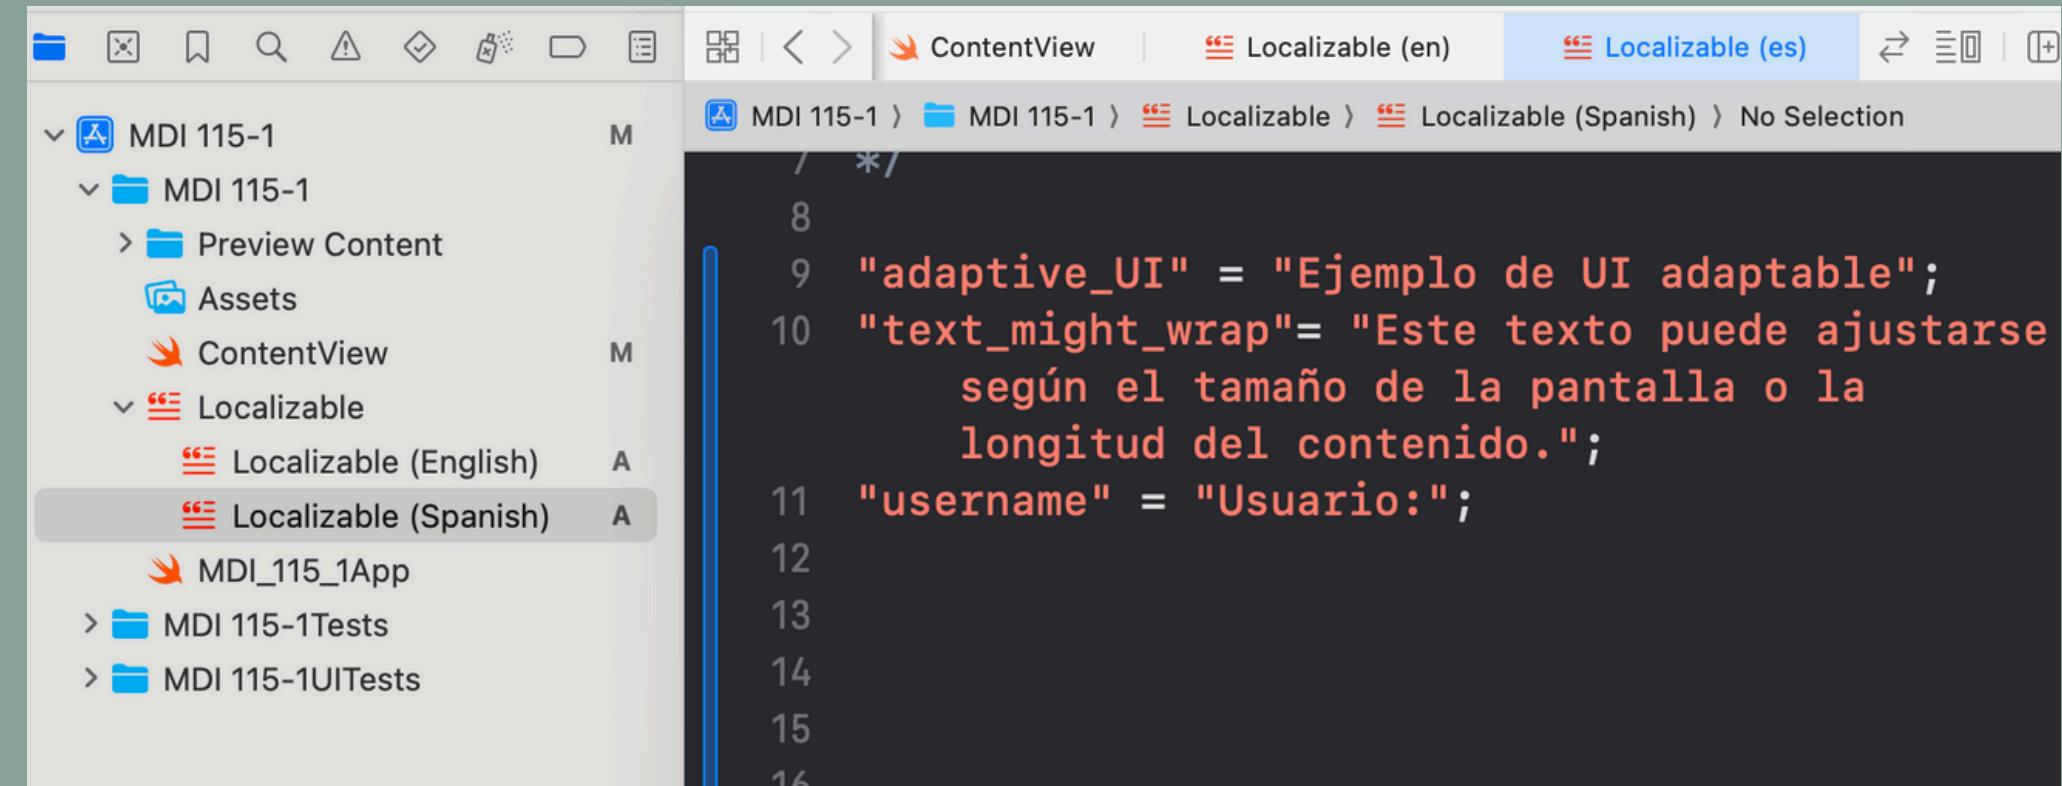

Step 3:
Change all your english strings to the localizable file (English)

The screenshot shows the Xcode interface with the file browser on the left and the content editor on the right. The file browser shows a project structure with a 'Localizable' folder containing 'Localizable (English)' and 'Localizable (Spanish)'. The content editor displays the 'Localizable (English)' file with the following content:

```
/* */  
8  
9 "adaptive_UI" = "Adaptive UI Example";  
10 "text_might_wrap" = "This text might wrap  
depending on screen size or content  
length.";  
11 "username" = "Username:";  
12 "enter_username" = "Enter username";  
13  
14  
15
```

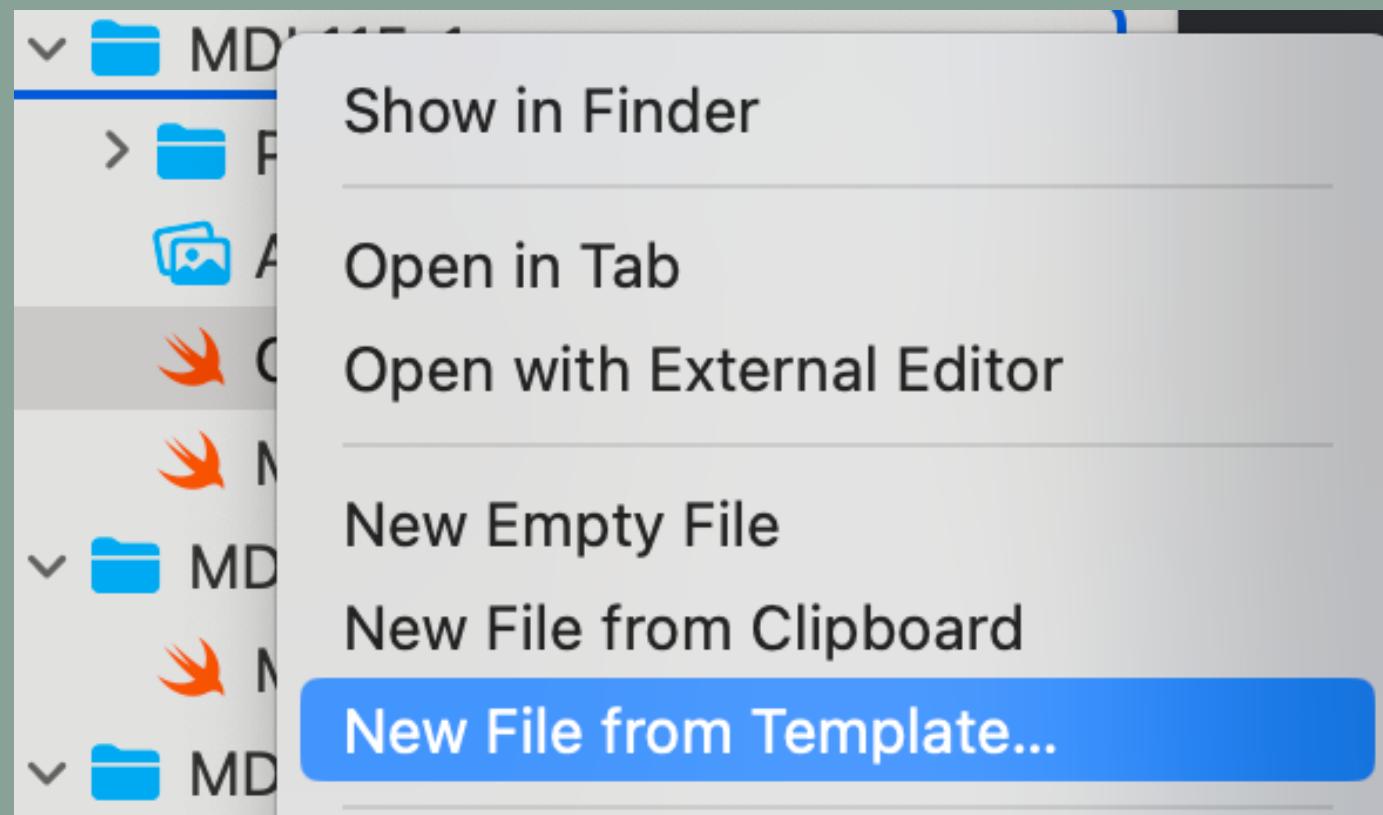

Step 4:
Add the translation into another localizable file (Spanish)

The screenshot shows the Xcode interface with the file browser on the left and the content editor on the right. The file browser shows a project structure with a 'Localizable' folder containing 'Localizable (English)' and 'Localizable (Spanish)'. The content editor displays the 'Localizable (Spanish)' file with the following content:

```
/* */  
8  
9 "adaptive_UI" = "Ejemplo de UI adaptable";  
10 "text_might_wrap" = "Este texto puede ajustarse  
según el tamaño de la pantalla o la  
longitud del contenido.";  
11 "username" = "Usuario:";  
12  
13  
14  
15  
16
```

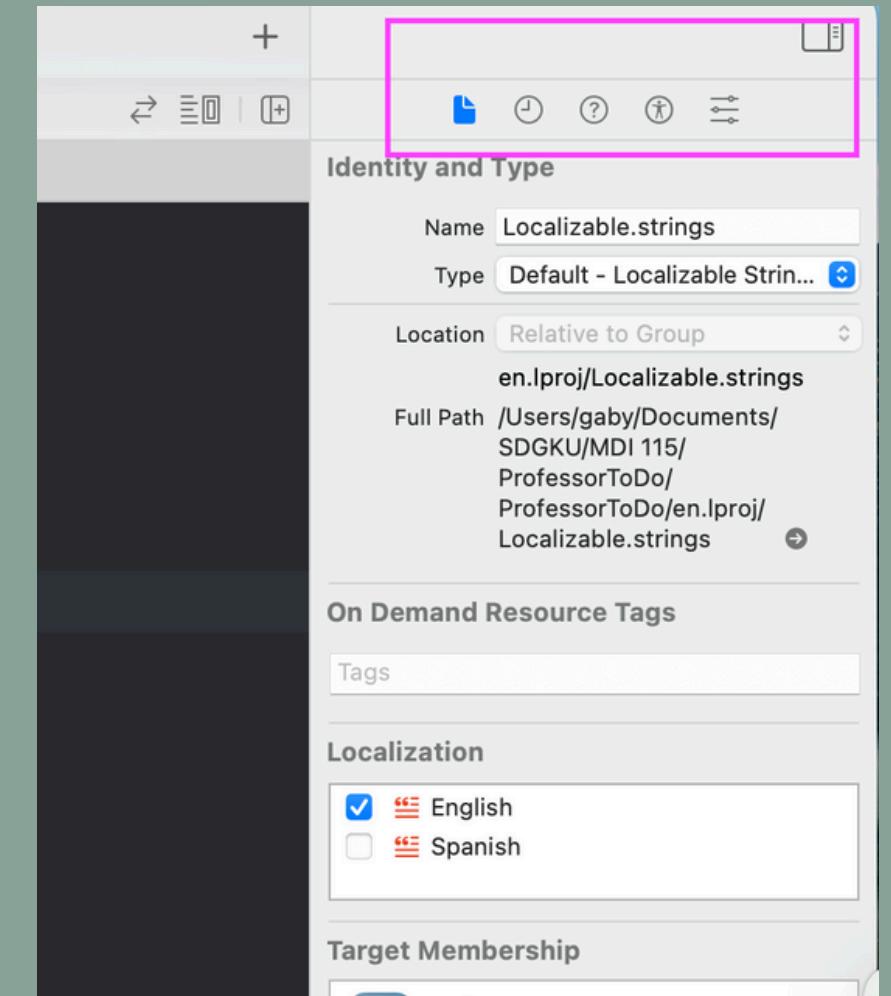

Catalog File (new)

Step 1:
Add a new File

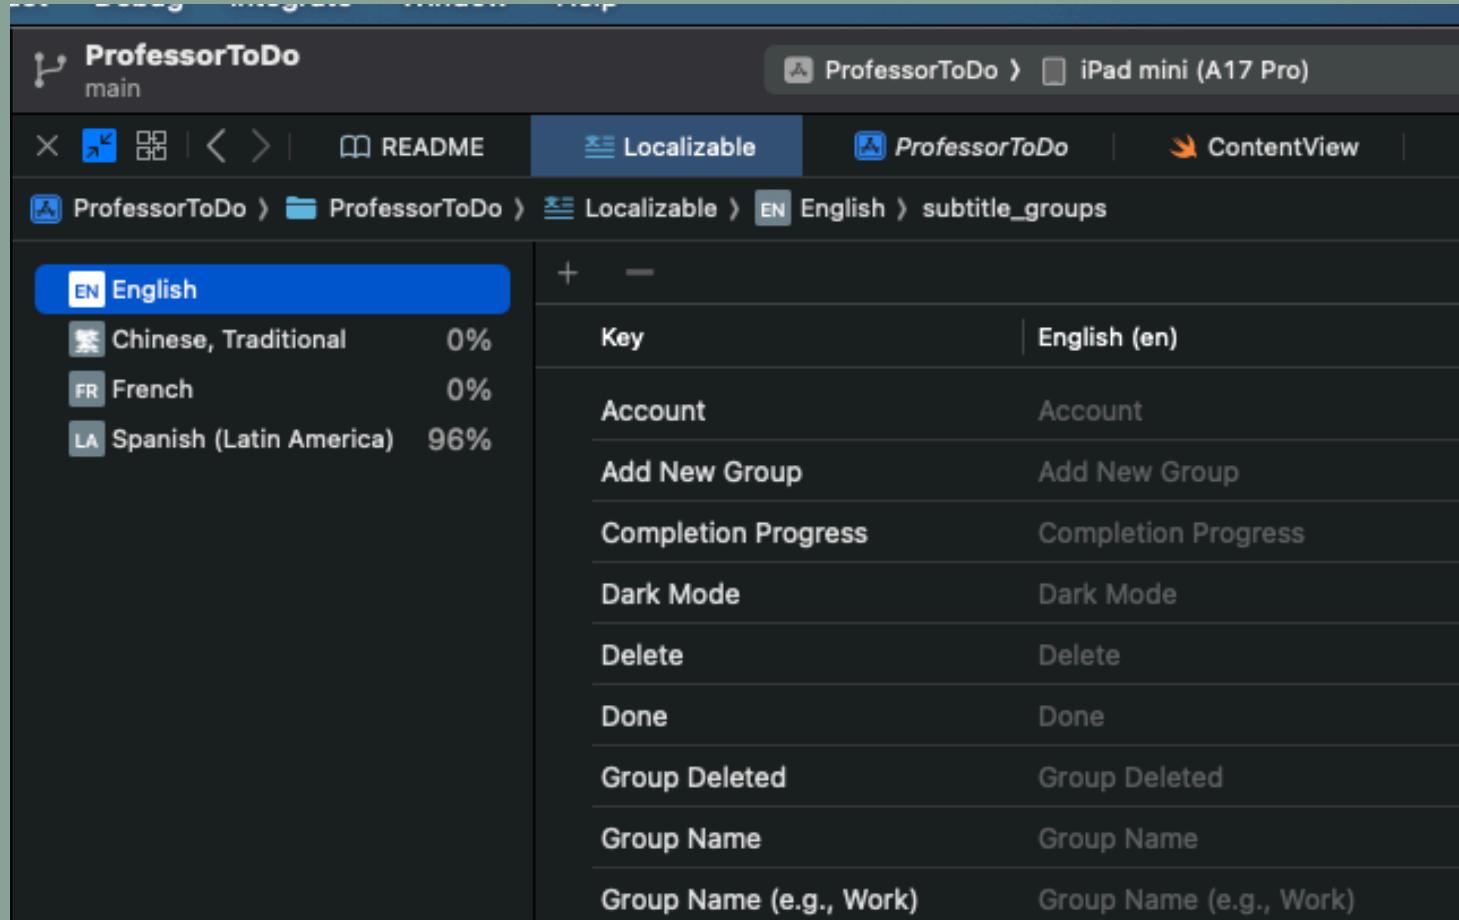

Step 2
Search for String Catalog

Step 2.1 (extra)
If you don't see your new language check that it is being added to your project target on the top-right corner of your project.

String Catalog

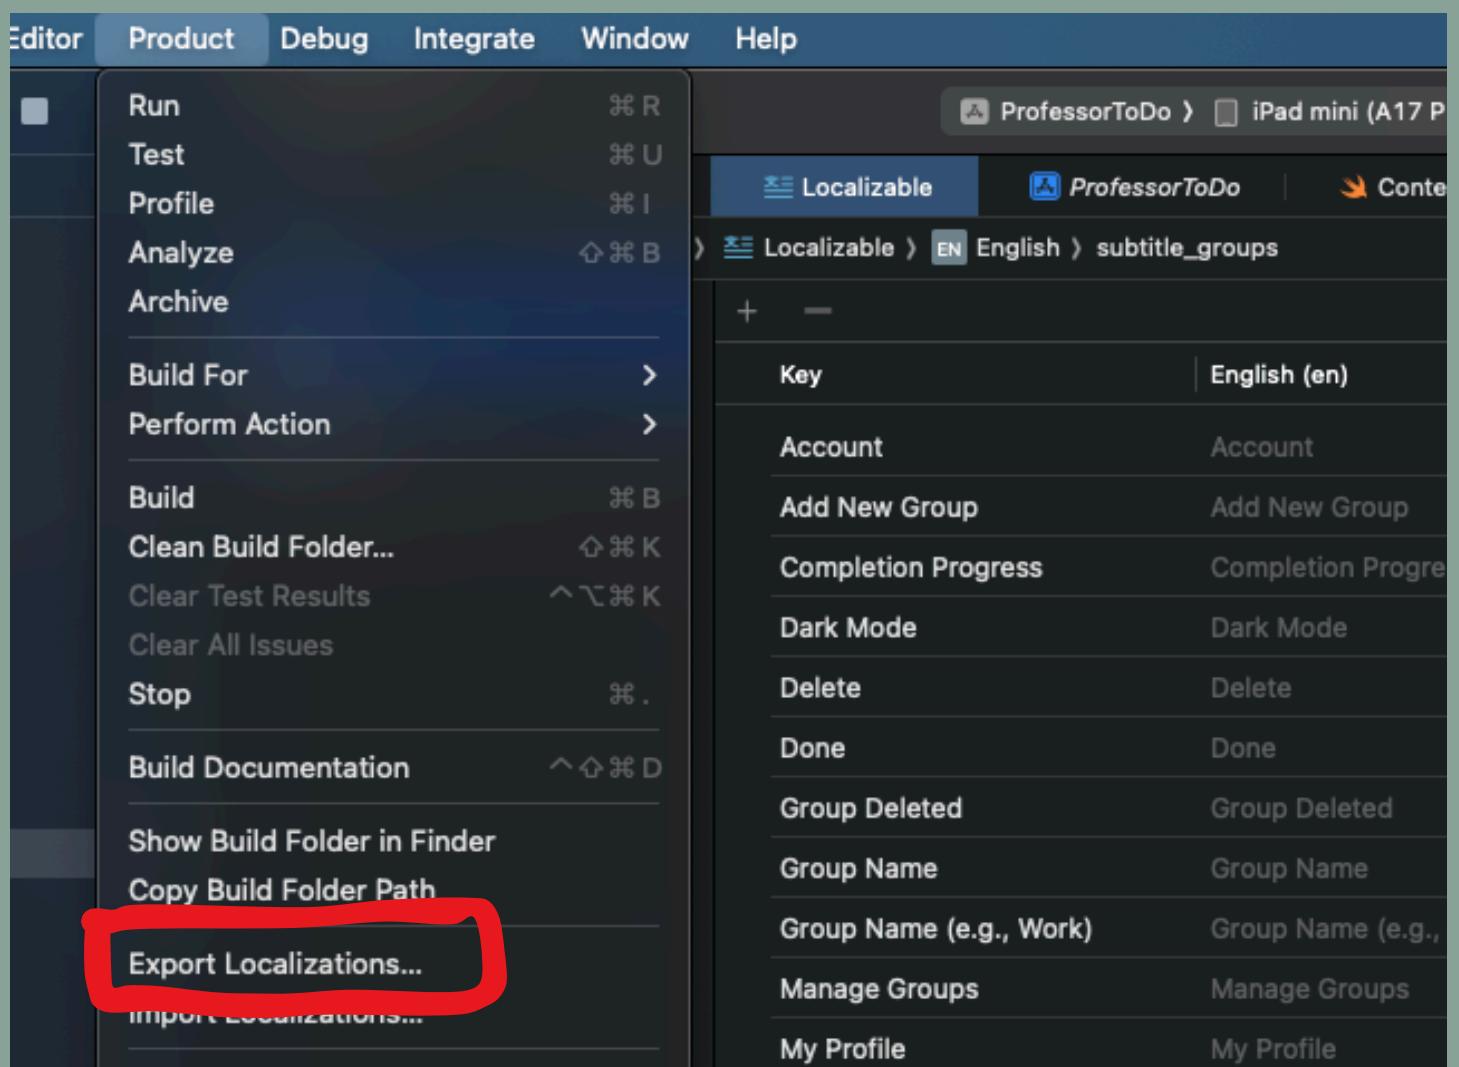

Step 3:
Build you app
(Command+b)
It should automatically
show all your text

A screenshot of a localization editor interface. The title bar shows "ProfessorToDo main". The top menu has items like "README", "Localizable" (which is selected and highlighted in blue), "ProfessorToDo", and "ContentView". The sidebar shows a file structure: ProfessorToDo > ProfessorToDo > Localizable > English > subtitle_groups. The main area displays a table of strings for the "EN English" locale. The table has two columns: "Key" and "English (en)". The keys listed are Account, Add New Group, Completion Progress, Dark Mode, Delete, Done, Group Deleted, Group Name, and Group Name (e.g., Work). The English column contains the corresponding text for each key.

Key	English (en)
Account	Account
Add New Group	Add New Group
Completion Progress	Completion Progress
Dark Mode	Dark Mode
Delete	Delete
Done	Done
Group Deleted	Group Deleted
Group Name	Group Name
Group Name (e.g., Work)	Group Name (e.g., Work)

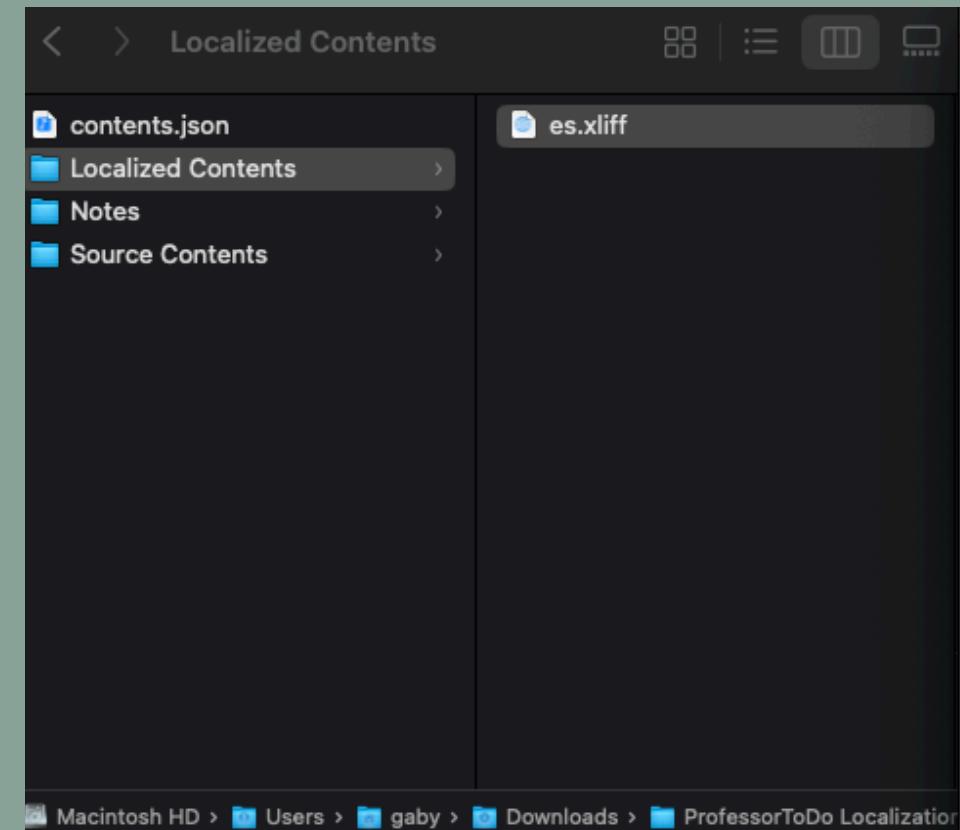

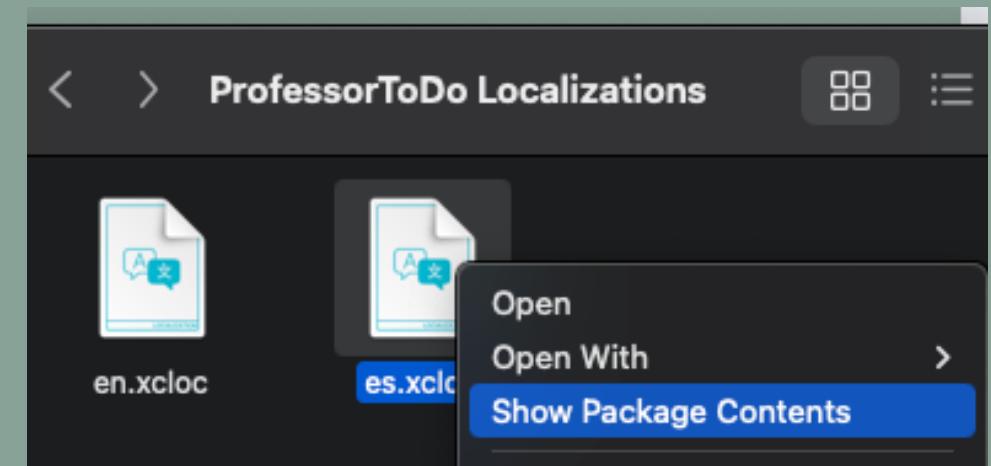

Step 4:
Export you files to be
translated
Product > Export
Localization

String Catalog

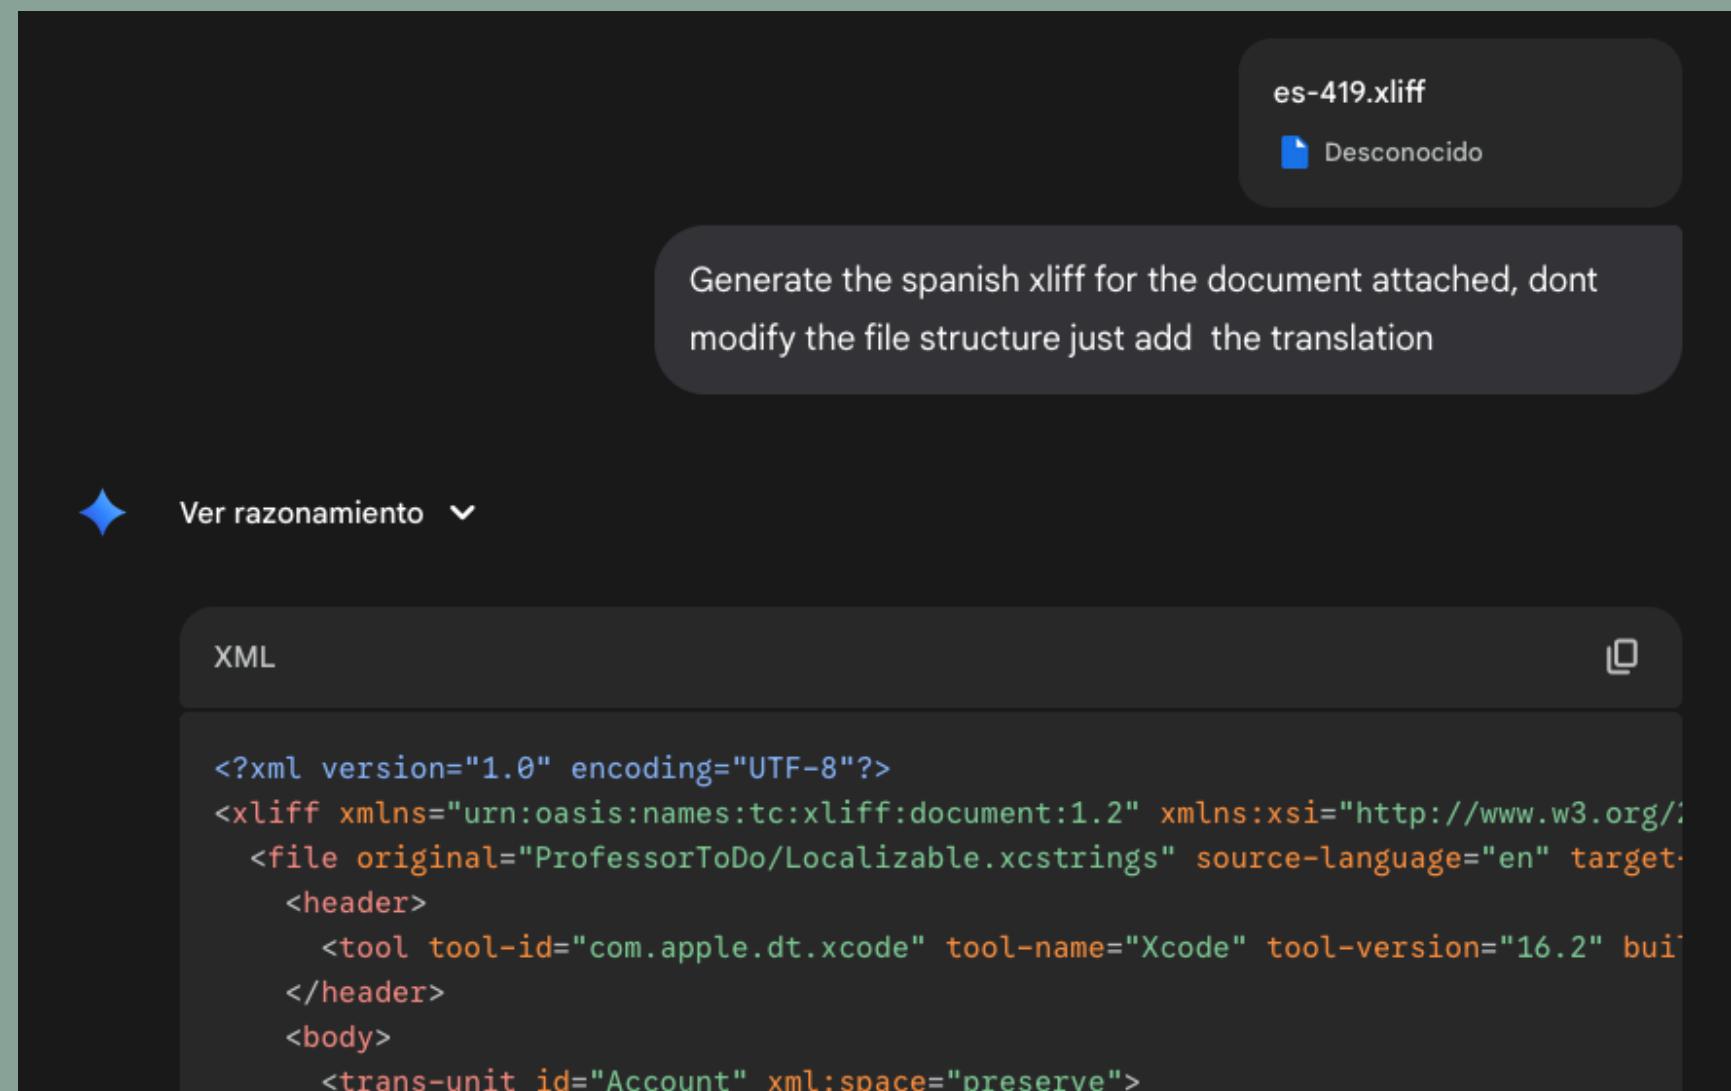

Step 5:

1. Open the folder downloaded.
2. Right click on the language to be translated, select "Show Package Content" and open the .xliff file

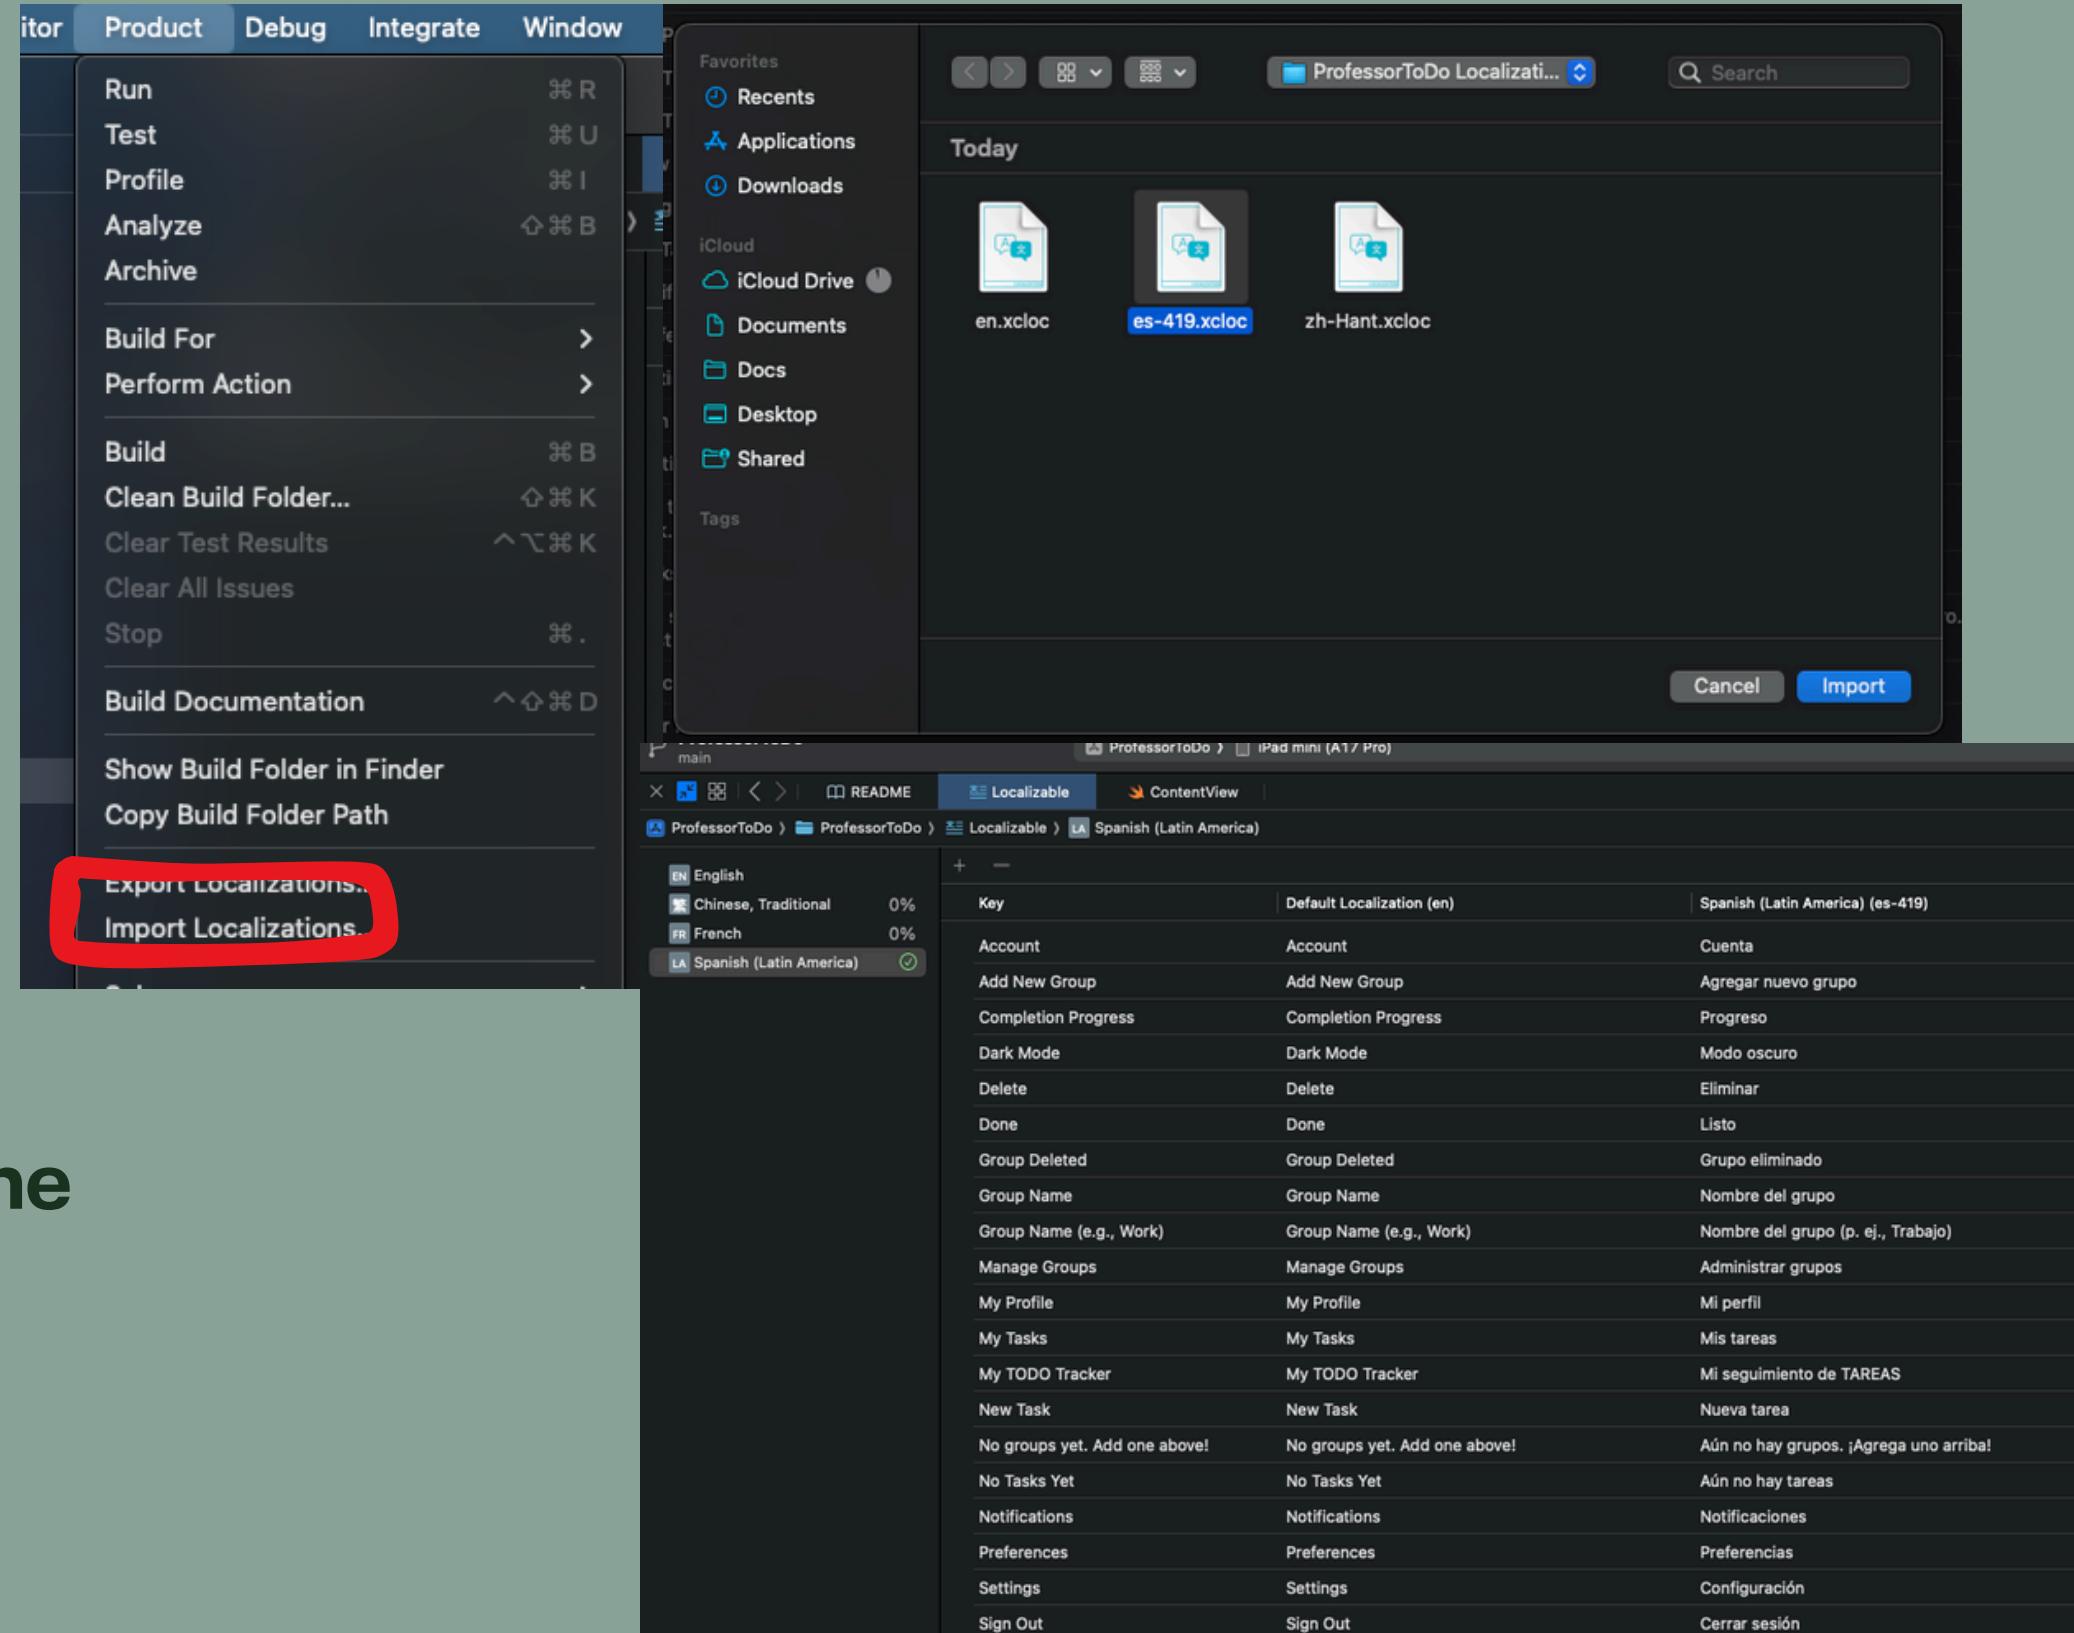

```
<?xml version="1.0" encoding="UTF-8"?>
<xliff xmlns="urn:oasis:names:tc:xliff:document:1.2" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation="http://docs.oasis-open.org/2001/XMLSchema.xsd" version="1.2">
<file original="ProfessorToDo/Localizable.xcstrings" source-language="en" target-language="es">
<header>
<tool tool-id="com.apple.dt.xcode" tool-name="Xcode" tool-version="16.2" build-type="Build">
</header>
<body>
<trans-unit id="Account" xml:space="preserve">
```

Step 6: Go to an AI Tool and get help translating your keywords

String Catalog

Step 7:
Paste your new
content inside the .xliff
file, save it and go back
to XCode

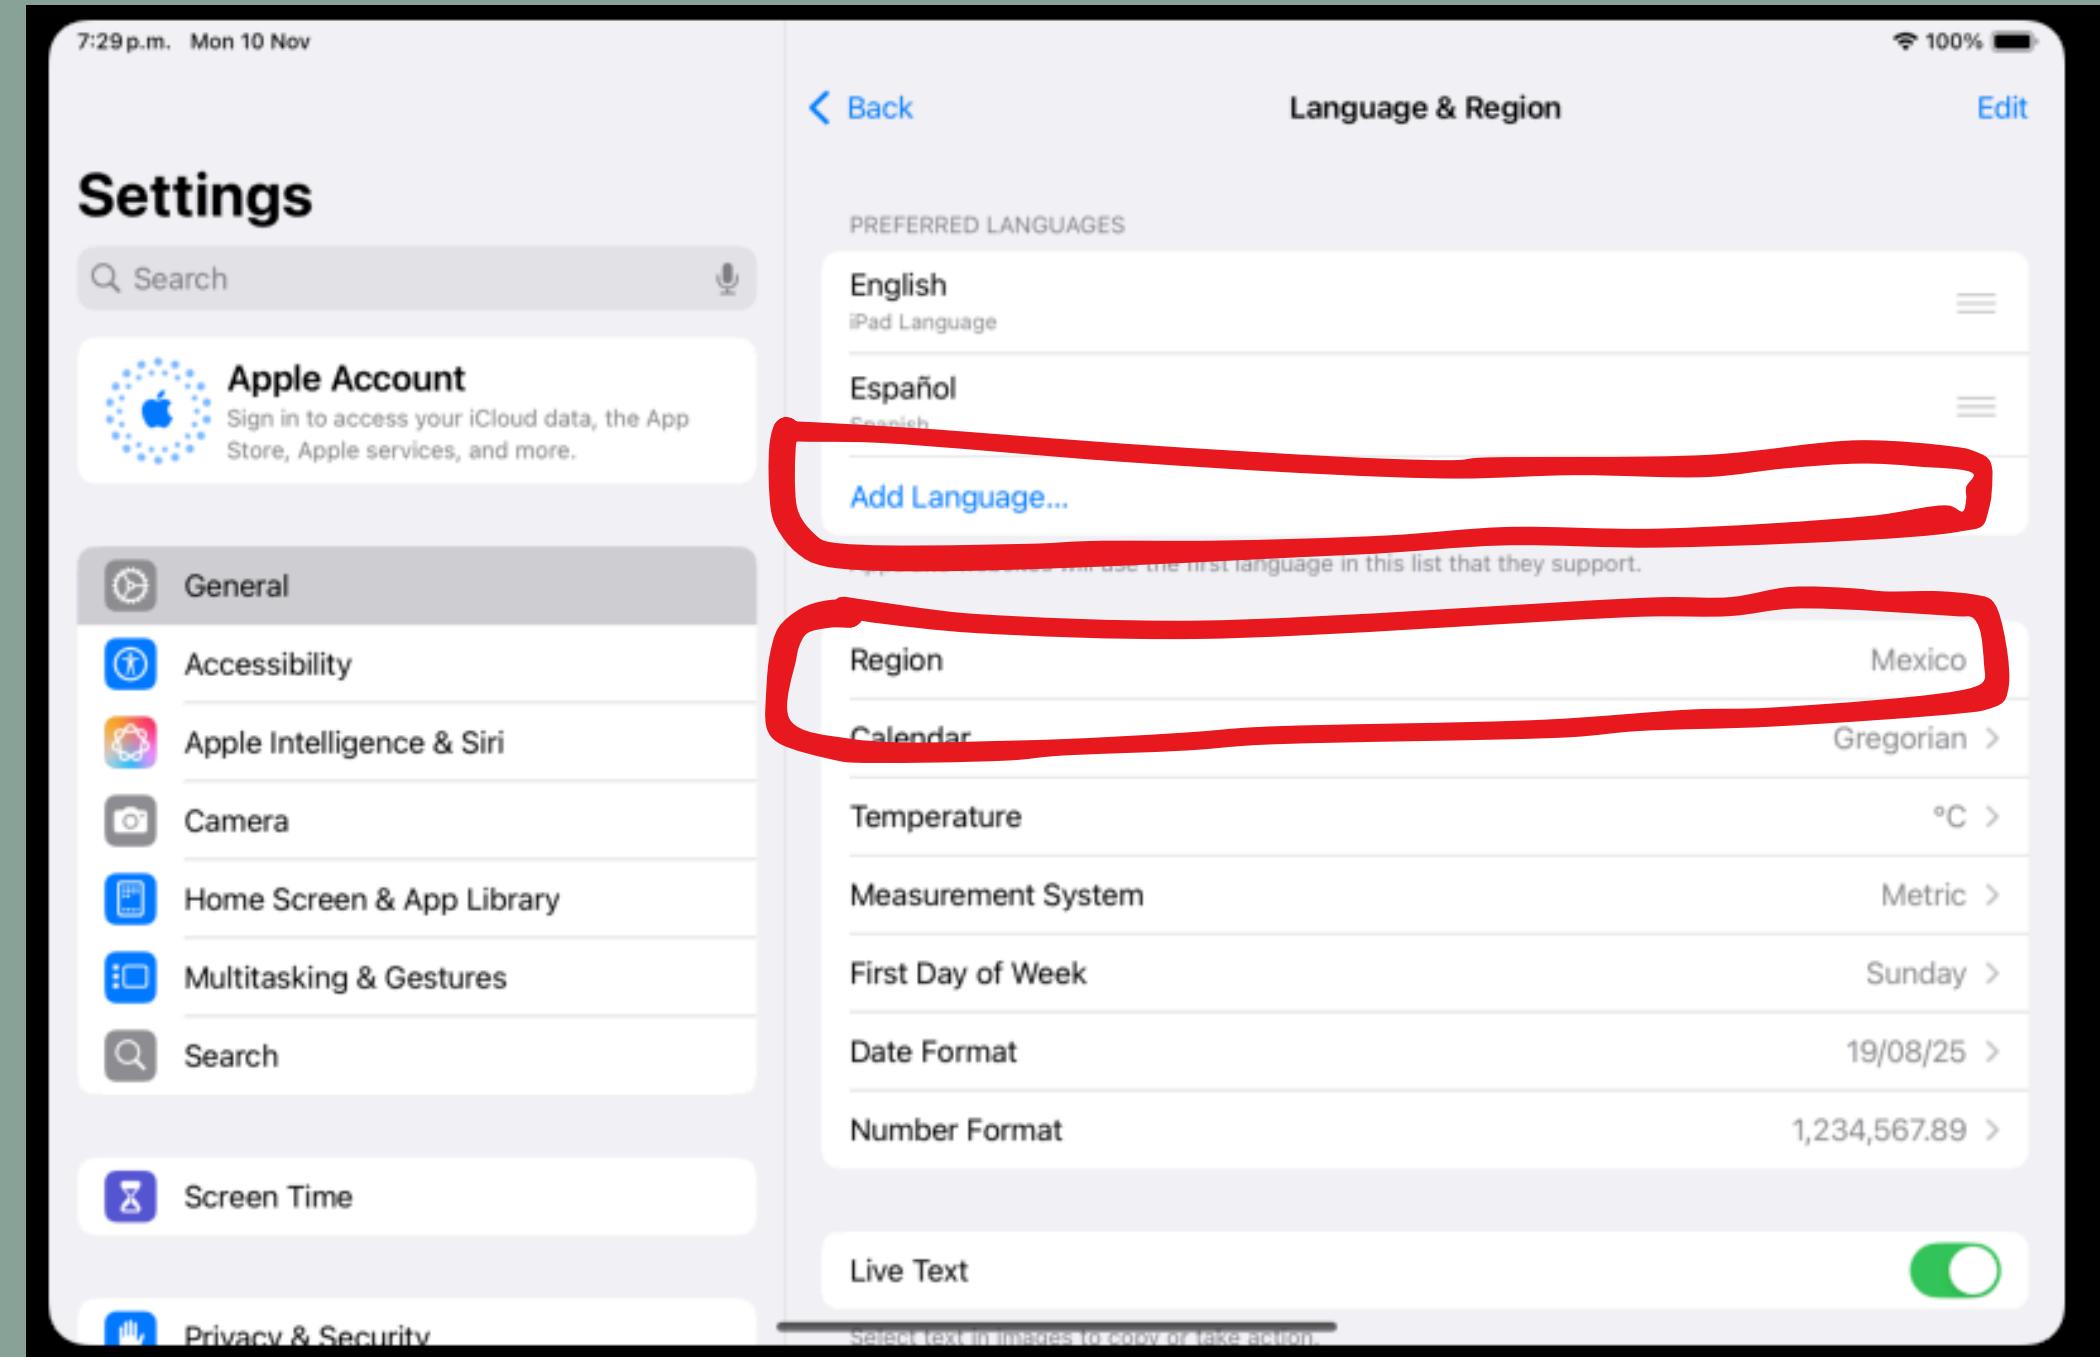

Step 8:
Product > Import
Localization > Select the
language of type .xloc

See the translation on
the String Catalog

String Catalog

Step 9:
Run your App, on the simulator:
Settings > Language and Redgion

Change both the Region and Language to see the correct change

```
var body: some View {  
    VStack(alignment: .leading) {  
        // Full date and time, localized  
        Text(now, style: .date)  
        // "October 17, 2025" in en-US  
        // "17 de octubre de 2025" in es-ES  
  
        Text(now, style: .time)  
        // "1:53 PM" in en-US  
        // "13:53" in es-ES  
  
        // Or combine them!  
        Text("Event Time: \(now.formatted(date: .long, time: .short))")  
    }  
}
```

Date and Number Formatting

Never format data manually! A user's locale determines the correct format.

Proper date and number formatting is essential for localization. SwiftUI provides tools to ensure that apps display **contextually appropriate** information according to user preferences and regional settings.

Let the System Do the Work:

- **Locale: Represents a user's language, region, and cultural conventions.**
- **DateFormatter: The classic way to configure specific date/time styles.**
- **SwiftUI's `.formatted()` API: The modern and preferred way.**

UI/UX Considerations

Designing for Diverse Global Audiences

When developing for a global audience, several **key design considerations** must be addressed:

- Accommodate text expansion in different languages
- Implement flexible layouts that adjust to varying text lengths
- Support bidirectional text for right-to-left languages
- Use Locale-aware formatters for date, time, currency, and number formats
- Ensure cultural customization of colors, icons, and images to resonate with local users
- Prioritize accessibility in localized contexts to meet diverse user needs

Adaptive SwiftUI layouts should utilize flexible elements such as **GeometryReader** to create responsive interfaces that adjust seamlessly. Implementing **dynamic type support** allows text to scale according to user preferences, enhancing readability. By considering these factors during the design phase, developers can create inclusive and user-friendly experiences for a wide range of audiences, ultimately leading to greater engagement and satisfaction.

Culturally relevant icons matter

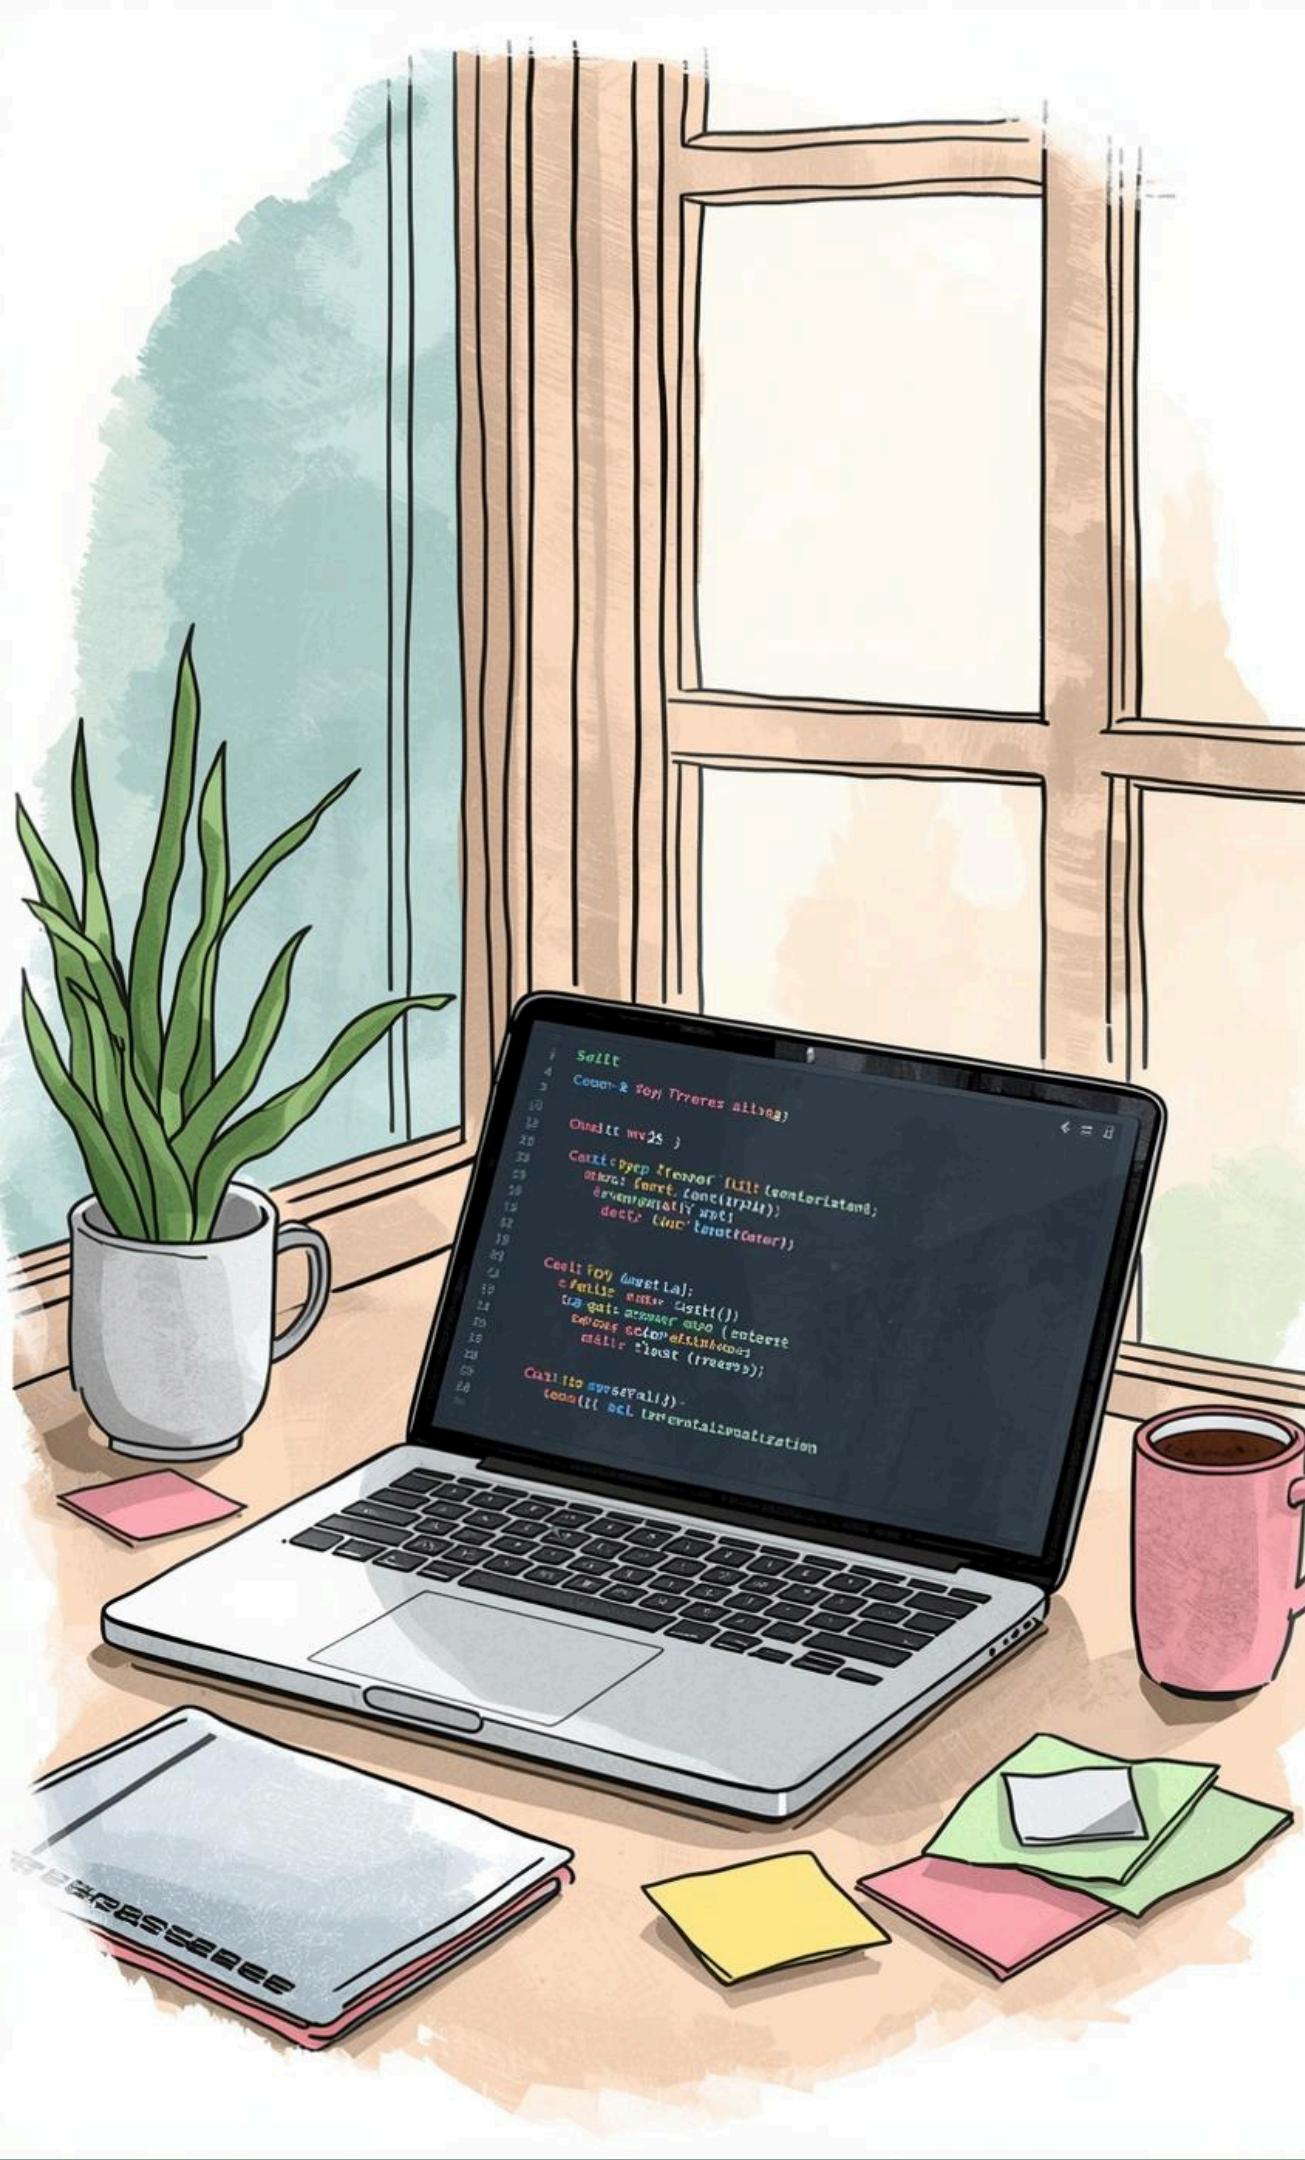

Culturally Relevant Icons Matter

- Icons are not a universal language. A symbol's meaning can change drastically between cultures.
- Using locally recognized symbols improves usability and avoids misunderstandings.
- Goal: Ensure your visual language is as clear and respectful as your written language.

Examples to Consider:

- Thumbs Up : Positive gesture in the US, but offensive in parts of the Middle East and West Africa.
- Mailbox : A US-style mailbox is unfamiliar in Japan or the UK. An envelope icon () is often a safer international choice.
- Owl : A symbol of wisdom in Western cultures, but considered a bad omen in some parts of Asia.

Assignment

Goal: Create a simple iPad app that demonstrates your understanding of localization and internationalization.

Requirements:

1. Localized Text:

- The app must contain at least two different languages to be translated (e.g. English & Spanish, English & Japannes)

2. Locale-Aware Date:

- Display the current date and/or time on your ToDo App, can be on the profile or whenever a new task is added to show **timeStamp**
- The format must automatically update to match the selected language (e.g., October 18, 2025 for English-US, 18 de octubre de 2025 for Spanish-MX).

3. Language Switcher:

- Switch Between languages from the phone settings
- The entire UI (text and date format) must update immediately when the language is changed.
